

ABSTRACT

in a pill case 1 comprising left and right side walls 4a, 4b, a rear wall 5 continued from the left and right side walls 4a, 4b and a bottom plate 6 provided between the left and right side walls 4a, 4b in the upper position of the lower ends of the left and right side walls 4a, 4b having an inclined face 9 obliquely upwardly inclined toward the front side from the rear wall 5, and the pill case 1 storing blister packs 30 put on the inclined face 9 of the bottom plate 6, a drawer 3 is placed in a space positioned below the bottom plate 6 and defined by the left and right side walls 4a, 4b and the bottom plate 6, so that the drawer 3 can be drawn toward the front. On the inside of left and right side walls 4a, 4b is provided at least a pair of opposed vertical grooves 22. And at least one pair of opposed vertical grooves 22 formed on inside of the left and right side walls 4a, 4b and a movable wall 21 engaging with the vertical grooves 22 to separate the space above the inclined face 9 of the bottom plate 6 into a front space and rear space.
